Internet Measurement and Data Analysis (13)

Kenjiro Cho

2014-01-08
Class 12 Search and Ranking (12/25)
- Search systems
- PageRank
- exercise: PageRank algorithm
today’s topics

Class 13 Scalable measurement and analysis

- Distributed parallel processing
- Cloud computing technology
- MapReduce
- exercise: MapReduce algorithm
measurement, data analysis and scalability

measurement methods
▶ network bandwidth, data volume, processing power on measurement machines

data collection
▶ collecting data from multiple sources
▶ network bandwidth, data volume, processing power on collecting machines

data analysis
▶ analysis of huge data sets
▶ repetition of relatively simple jobs
▶ complex data processing by data mining methods
▶ data volume, processing power of analyzing machines
  ▶ communication power for distributed processing
computational complexity

metrics for the efficiency of an algorithm

- time complexity
- space complexity
- average-case complexity
- worst-case complexity

big O notation

- describe algorithms simply by the growth order of execution time as input size $n$ increases
  - example: $O(n), O(n^2), O(n \log n)$
- more precisely, “$f(n)$ is order $g(n)$” means:
  for function $f(n)$ and function $g(n)$, $f(n) = O(g(n)) \iff$ there exist constants $C$ and $n_0$ such that
  $|f(n)| \leq C|g(n)|$ $(\forall n \geq n_0)$
computational complexity

- logarithmic time
- polynomial time
- exponential time

![Graph showing computation time vs. input size for different complexities](image-url)
example of computational complexity

search algorithms
▶ linear search: $O(n)$
▶ binary search: $O(\log_2 n)$

sort algorithms
▶ selection sort: $O(n^2)$
▶ quick sort: $O(n \log_2 n)$ on average, $O(n^2)$ for worst case

in general,
▶ linear algorithms (e.g., loop): $O(n)$
▶ binary trees: $O(\log n)$
▶ double loops for a variable: $O(n^2)$
▶ triple loops for a variable: $O(n^3)$
▶ combination of variables (e.g., shortest path): $O(c^n)$
distributed algorithms

parallel or concurrent algorithms
  ▶ split a job and process them by multiple computers
  ▶ issues of communication cost and synchronization

distributed algorithms
  ▶ assume that communications are message passing among independent computers
  ▶ failures of computers and message losses

merits
  ▶ scalability
    ▶ improvement is only linear at best
  ▶ fault tolerance
scale-up and scale-out

- **scale-up**
  - strengthen or extend a single node
  - without issues of parallel processing

- **scale-out**
  - extend a system by increasing the number of nodes
  - cost performance, fault-tolerance (use of cheap off-the-shelf computers)
cloud computing

cloud computing: various definitions

▶ broadly, computer resources behind a wide-area network

background

▶ market needs:
  ▶ outsourcing IT resources, management and services
    ▶ no initial investment, no need to predict future demands
  ▶ cost reduction as a result
  ▶ as well as risk management and energy saving, especially after the Japan Earthquake

▶ providers: economy of scale, walled garden
  ▶ efficient use of resource pool
various clouds

- public/private/hybrid
- service classification: SaaS/PaaS/IaaS
physical clouds
typical cloud network topology
key technologies

▶ virtualization: OS level, I/O level, network level
▶ utility computing
▶ energy saving
▶ data center networking
▶ management and monitoring technologies
▶ automatic scaling and load balancing
▶ large-scale distributed data processing

▶ related research fields: networking, OS, distributed systems, database, grid computing
  ▶ led by commercial services
economics of cloud

- economies of scale (purchase cost, operation cost, statistical multiplexing)
- commodity hardware
- economical locations (including airconditioning, electricity, networking)

Will Japanese clouds be competitive in the global market? (The bigger, the better?)
MapReduce

MapReduce: a parallel programming model developed by Google

Dean, Jeff and Ghemawat, Sanjay.
MapReduce: Simplified Data Processing on Large Clusters.
http://labs.google.com/papers/mapreduce.html

the slides are taken from the above materials

motivation: large scale data processing

▶ want to use hundreds or thousands of CPUs for large data processing
▶ make it easy to use the system without understanding the details of the hardware infrastructures

MapReduce provides

▶ automatic parallelization and distribution
▶ fault-tolerance
▶ I/O scheduling
▶ status and monitoring
MapReduce programming model

Map/Reduce
- idea from Lisp or other functional programming languages
- generic: for a wide range of applications
- suitable for distributed processing
- able to re-execute after a failure

Map/Reduce in Lisp
(map square '(1 2 3 4)) \rightarrow (1 4 9 16)
(reduce + '(1 4 9 16)) \rightarrow 30
Map/Reduce in MapReduce

map(in_key, in_value) → list(out_key, intermediate_value)
  ▶ key/value pairs as input, produce another set of key/value pairs
reduce(out_key, list(intermediate_value)) → list(out_value)
  ▶ using the results of map(), produce a set of merged output values for a particular key

example: count word occurrences

map(String input_key, String input_value):
  // input_key: document name
  // input_value: document contents
  for each word w in input_value:
    EmitIntermediate(w, "1");

reduce(String output_key, Iterator intermediate_values):
  // output_key: a word
  // output_values: a list of counts
  int result = 0;
  for each v in intermediate_values:
    result += ParseInt(v);
  Emit(AsString(result));
other applications

- distributed grep
  - map: output lines matching a supplied pattern
  - reduce: nothing

- count of URL access frequency
  - map: reading web access log, and outputs `<URL, 1>`
  - reduce: adds together all values for the same URL, and emits `<URL, count>`

- reverse web-link graph
  - map: outputs `<target, source>` pairs for each link in web pages
  - reduce: concatenates the list of all source URLs associated with a given target URL and emits the pair `<target, list(source)>`

- inverted index
  - map: emits `<word, docID>` from each document
  - reduce: emits the list of `<word, list(docID)>`
MapReduce Execution Overview

source: MapReduce: Simplified Data Processing on Large Clusters
MapReduce Execution

source: MapReduce: Simplified Data Processing on Large Clusters
MapReduce Parallel Execution

source: MapReduce: Simplified Data Processing on Large Clusters
Task Granularity and Pipelining

- tasks are fine-grained: the number of Map tasks $>>$ number of machines
  - minimizes time for fault recovery
  - can pipeline shuffling with map execution
  - better dynamic load balancing
- often use 2,000 map/5,000 reduce tasks w/ 2,000 machines

source: MapReduce: Simplified Data Processing on Large Clusters
fault tolerance: handled via re-execution

on worker failure

- detect failure via periodic heartbeats
- re-execute completed and in-progress map tasks
  - need to re-execute completed tasks as results are stored on local disks
- re-execute in progress reduce tasks
- task completion committed through master

robust: lost 1600 of 1800 machines once, but finished fine

source: MapReduce: Simplified Data Processing on Large Clusters
refinement: redundant execution

slow workers significantly lengthen completion time
  ▶ other jobs consuming resources on machine
  ▶ bad disks with soft errors transfer data very slowly
  ▶ weird things: processor caches disabled (!!)

solution: near end of phase, spawn backup copies of tasks
  ▶ whichever one finishes first “wins”

effect: drastically shortens completion time
refinement: locality optimization

master scheduling policy
- asks GFS for locations of replicas of input file blocks
- map tasks typically split into 64MB (== GFS block size)
- map tasks scheduled so GFS input block replicas are on same machine or same rack

effect: thousands of machines read input at local disk speed
- without this, rack switches limit read rate
refinement: skipping bad records

Map/Reduce functions sometimes fail for particular inputs
- best solution is to debug and fix, but not always possible
- on Segmentation Fault
  - send UDP packet to master from signal handler
  - include sequence number of record being processed
- if master sees two failures for same record,
  - next worker is told to skip the record

effect: can work around bugs in third party libraries
other refinement

- sorted order is guaranteed within each reduce partition
- compression of intermediate data
- Combiner: useful for saving network bandwidth
- local execution for debugging/testing
- user-defined counters
performance

test run on cluster of 1800 machines

- 4GB of memory
- Dual-processor 2GHz Xeons with Hyperthreading
- Dual 160GB IDE disks
- Gigabit Ethernet per machine
- Bisection bandwidth approximately 100Gbps

2 benchmarks:

- MR_Grep: scan \(10^{10}\) 100-byte records to extract records matching a rare pattern (92K matching records)
- MR_Sort: sort \(10^{10}\) 100-byte records (modeled after TeraSort benchmark)
MR_Grep

- locality optimization helps
  - 1800 machines read 1TB of data at peak of 31GB/s
  - without this, rack switches would limit to 10GB/s
- startup overhead is significant for short jobs

source: MapReduce: Simplified Data Processing on Large Clusters
MR_Sort

- backup tasks reduce job completion time significantly
- system deals well with failures

Normal (left) No backup tasks (middle) 200 processes killed (right)

source: MapReduce: Simplified Data Processing on Large Clusters
Hadoop MapReduce

- Hadoop
  - open source software by the Apache Project
  - Java software framework
  - implementation of Google’s GFS and Mapreduce
  - widely used for large-scale data analysis platform

- Hadoop MapReduce
  - Java implementation
  - servers and libraries for MapReduce processing
  - Master/Slave architecture

        while (values.hasNext()) {
            sum += values.next().get();
        }
        output.collect(key, new IntWritable(sum));
    }
}
```java
public static void main(String[] args) throws Exception {
    JobConf conf = new JobConf(WordCount.class);
    conf.setJobName("wordcount");

    conf.setOutputKeyClass(Text.class);
    conf.setOutputValueClass(IntWritable.class);

    conf.setMapperClass(Map.class);
    conf.setCombinerClass(Reduce.class);
    conf.setReducerClass(Reduce.class);

    conf.setInputFormat(TextInputFormat.class);
    conf.setOutputFormat(TextOutputFormat.class);

    FileInputFormat.setInputPaths(conf, new Path(args[0]));
    FileOutputFormat.setOutputPath(conf, new Path(args[1]));

    JobClient.runJob(conf);
}
```
today’s exercise: WordCount in Ruby

MapReduce-style programming in Ruby

```bash
% cat wc-data.txt
Hello World Bye World
Hello Hadoop Goodbye Hadoop
% cat wc-data.txt | ruby wc-map.rb | sort | ruby wc-reduce.rb
bye 1
goodbye 1
hadoop 2
hello 2
world 2
```
WordCount in Ruby: Map

#!/usr/bin/env ruby
#
# word-count map task: input <text>, output a list of <word, 1>

ARGF.each_line do |line|
  words = line.split(/\W+/)
  words.each do |word|
    if word.length < 20 && word.length > 2
      printf "\%s\t1\n", word.downcase
    end
  end
end
WordCount in Ruby: Reduce

```ruby
#!/usr/bin/env ruby
#
# word-count reduce task: input a list of <word, count>, output <word, count>
# assuming the input is sorted by key
current_word = nil
current_count = 0
word = nil

ARGF.each_line do |line|
  word, count = line.split
  if current_word == word
    current_count += count.to_i
  else
    if current_word != nil
      printf "%s\t%d\n", current_word, current_count
    end
    current_word = word
    current_count = count.to_i
  end
end
if current_word == word
  printf "%s\t%d\n", current_word, current_count
end
```

MapReduce summary

- MapReduce: abstract model for distributed parallel processing
- considerably simplify large-scale data processing
- easy to use, fun!
  - the system takes care of details of parallel processing
  - programmers can concentrate on solving a problem
- various applications inside Google including search index creation

additional note

- Google does not publish the implementation of MapReduce
- Hadoop: open source MapReduce implementation by Apache Project

on the final report

- select A or B
  - B. free topic
- up to 8 pages in the PDF format
- submission via SFC-SFS by 2014-01-28 (Tue) 23:59
final report topics

A. PageRank computation of Wikipedia
   ▶ data: link data within Wikipedia English version (5.7M pages)
   ▶ A-1 investigate the distribution of pages
     ▶ A-1-1 plot CDF and CCDF of the outdegree of pages
     ▶ A-1-2 discussion on the outdegree distribution of Wikipedia pages
   ▶ A-2 PageRank computation
     ▶ A-2-1 compute PageRank, and show the top 30 of the results
     ▶ A-2-2 other analysis (optional)
     ▶ A-2-3 discussion on the results

B. free topic
   ▶ select a topic by yourself
   ▶ the topic is not necessarily on networking
   ▶ but the report should include some form of data analysis and discussion about data and results
A. PageRank computation of Wikipedia

data: link data of Wikipedia English version (5.7M pages)
  ▶ created by Henry Haselgrove in 2009 (http://haselgrove.id.au/wikipedia.htm)
    ▶ a local copy is available from the class web page
    ▶ a test data set (a subset of 100K pages)
  ▶ links-simple-sorted.zip: link data (324MB compressed, 1GB uncompressed)
    ▶ each page has an unique integer ID
    ▶ format: from: to_1, to_2, ... to_n
  ▶ titles-sorted.zip: title data (29MB compressed, 106MB uncompressed)
    ▶ n-th line: the title of page ID n (1 origin)

% head -3 links-simple-sorted.txt
1: 1664968
2: 3 747213 1664968 1691047 4095634 5535664
3: 9 77935 79583 84707 564578 594898 681805 681886 835470 ...
%
% sed -n '2713439p' titles-sorted.txt
Keio-Gijuku_University
A-1 investigate the distribution of pages

- A-1-1 plot CDF and CCDF of the outdegree of pages
  - include pages with outdegree 0
- A-1-2 discussion on the outdegree distribution of Wikipedia pages
  - optional other analysis
  - hint: you may compare low-degree pages and high-degree pages
A-2 PageRank computation

A-2-1 compute PageRank, and show top 30 of the results
  ▶ format: rank PageRank_value page_ID page_title
  ▶ you may use the script for the exercise
    ▶ use damping factor: 0.85 thresh: 0.000001
  ▶ takes 5 hours with iMac with 8GB memory (requiring at least 4GB memory)

A-2-2 other analysis (optional)
  ▶ examples:
    ▶ how to reduce the processing time
    ▶ implement an improved version of the PageRank algorithm

A-2-3 discussion on the results
summary of the class

what you have learned in the class

- how to understand statistical aspects of data, and how to process and visualize data
  - which should be useful for writing thesis and other reports
- programming skills to process a large amount of data
  - beyond what the existing package software provide
- ability to suspect statistical results
  - the world is full of dubious statistical results and information manipulations
  - (improving literacy on online privacy)
It becomes possible to access a huge amount of diverse data through the Internet. It allows us to obtain new knowledge and create new services, leading to an innovation called "Big Data" or "Collective Intelligence". In order to understand such data and use it as a tool, one needs to have a good understanding of the technical background in statistics, machine learning, and computer network systems.

In this class, you will learn about the overview of large-scale data analysis on the Internet, and basic skills to obtain new knowledge from massive information for the forthcoming information society.
Theme, Goals, Methods
In this class, you will learn about data collection and data analysis methods on the Internet, to obtain knowledge and understanding of networking technologies and large-scale data analysis.

Each class will provide specific topics where you will learn the technologies and the theories behind the technologies. In addition to the lectures, each class includes programming exercises to obtain data analysis skills through the exercises.

Prerequisites
The prerequisites for the class are basic programming skills and basic knowledge about statistics.

In the exercises and assignments, you will need to write programs to process large data sets, using the Ruby scripting language and the Gnuplot plotting tool. To understand the theoretical aspects, you will need basic knowledge about algebra and statistics. However, the focus of the class is to understand how mathematics is used for engineering applications.
summary

Class 13 Scalable measurement and analysis
  ▶ Distributed parallel processing
  ▶ Cloud computing technology
  ▶ MapReduce
  ▶ exercise: MapReduce algorithm
